Gabrielle McCrae

Project 5 Brief Report

In this project, I made the website using the editor Brackets. This editor helped me create a website that will help me design a visually pleasant portal with links to all my projects and homework assignments during this course, using HTML 5, CSS, and bootstrap. To start off I had to make the index a PHP file since that is what project 0 had project 5 be. This took some times for me to realize this because when I was ready turn this in, the website kept saying "File Not Found", luckily, I realized it just in time, and thankfully, I can make the other links html files so I don't have to worry about that. To differentiate between project 5 and project 0, besides clicking on the project, I made the background of project 5 a pretty coral color as well as make the first heading align in the center, make the li font larger as well as the paragraph font larger as well. In project 1, I modified it so, for 1 you can see it, because in the first attempt, it wasn't showing and I don't know why, don't worry, I fixed that in project1 as well. Before I modified project 1, I was having a little trouble on how to go from the index to project 1. I later realized that I was thinking too hard and all I had to do was link it like how I would link my CSS and/or JavaScript. Project 2 was easy to link and I didn't have to fix anything. In project 3, I had to fix the CSS because when I saw it in the live preview, it did not look the same as it did when I turned it in. Thankfully it fixed itself when I uploaded it on WinSCP. Lastly, project 4 was also easy to link, however in the JavaScript, I have warnings, but they don't seem to really affect the website, so I just let them be. After turning it in the first time, I got an emailing stating that instead of the project being in a project 5 file, it should instead be the homepage itself. If I understood what they meant, it should look like the optional project, p0, but with a css and the other projects. After realizing what they meant, I went to fix it, and now I don't have to worry about the PHP file.
